

Prompt: Show code snippets to add a font family of Google Fonts. Only consider @import rule

Sure, here is an example of how to add a font family of Google Fonts using the @import rule:

CSS

```
@import
url('https://fonts.googleapis.com/css2?family=Roboto:wght@300;400;500;700&
display=swap');
```

This code will import the Roboto font family from Google Fonts and make it available to use on your website. The font will be available in four weights: 300, 400, 500, and 700.

To use the font, you can simply specify the font family name in the CSS font-family property. For example, to use the Roboto font family for all headings, you would add the following code to your CSS file:

CSS

```
h1, h2, h3 {
  font-family: Roboto;
}
```

You can also use the font for other elements on your website, such as paragraphs, lists, and buttons.

Here is a complete example of how to add a font family of Google Fonts to a website:

HTML

```
<!DOCTYPE html>
<html>
<head>
  <title>My Website</title>
  <link rel="stylesheet" href="style.css">
</head>
<body>
  <h1>This is a heading</h1>
  <p>This is a paragraph</p>
  <button>This is a button</button>
</body>
</html>
```

CSS

```
@import
```

```
url('https://fonts.googleapis.com/css2?family=Roboto:wght@300;400;500;700&
display=swap');
```

```
h1, h2, h3 {
  font-family: Roboto;
}
```

This website will now use the Roboto font family for all headings, paragraphs, and buttons.
